Operational Cache Study

This two-column report fixture stresses reading order, figure anchoring, and caption extraction. The left column contains narrative text about throughput and cache hit rate. The right column mixes a chart image, caption, and compact notes.

We observed a throughput increase after aggressive cache priming. The cache hit rate rose from 41 percent to 78 percent while median page latency dropped by 26 milliseconds.

Key findings

- throughput increased on every batch
- cache hit rate is now a first-class metric
- figure 2 summarizes the latency histogram

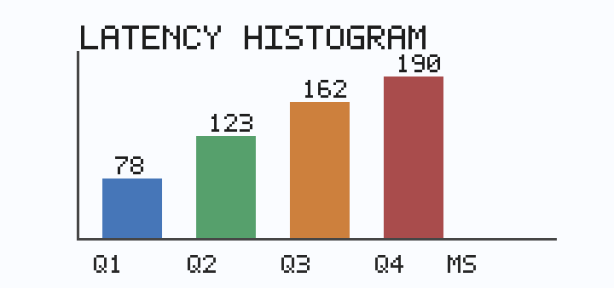

Figure 2. Latency histogram after cache warmup.

The chart combines queue latency, worker throughput, and cache hit rate in one compact visual. A parser should keep the caption attached to the figure and

Sidebar: prioritize latency histogram over averages.
